

SuperAnimal-Quadruped — the original 39 keypoints

The pretrained DeepLabCut model this project extends. All 39 are still predicted, unchanged: measured drift after fine-tuning is 0.0000.

Median predicted pose over 23 frames of the project's test clip, normalised into the detector box

* merged: a DogFLW landmark is supervised on this existing channel, so no new output was created. 9 of the 39.
donor xN: N added channels copied this keypoint's filter as their starting point. A donor is only an initialisation - the added channel is separate.
